Total suspended solids	mg/L (Note 1)	Daily during any discharge	50	21/11/2012	200
Exceedance Information	Due to site weather conditions on this date, collected surface water in the Western Sediment basins was being used for dust suppression on the site. While transferring water between basins ready to use for this purpose it was observed that the lower basin had reached maximum hold capacity resulting in a low volume discharge of water over the basin wall for a duration of not more than 15 minutes. The water transfer was immediately halted and the water was sampled and laboratory tested. The water volume in the basin was reduced via pumping into the on site water tanker to prevent any continuation of surface water discharge. Operational procedures have subsequently been reviewed and additional training organised to prevent any similar situation occurring in future.
